Sphere Companion: How It Works

Concept only. Not yet built. All figures are planning estimates.

What it is

Sphere Companion is a concept for a small wearable device that listens, looks, and speaks. It clips to a jacket or bag strap, so you can ask for help without taking out your phone.

Parts of the device

• **Microphone:** hears your voice when you call it.

• **Camera with privacy shutter:** sees what is in front of you, only when you ask. The shutter covers the lens when closed.

• **Speaker:** plays the answer out loud.

• **Status light:** glows when the device is listening or recording, so people nearby know.

• **Wi-Fi link:** sends data to your phone and receives answers back.

• **Battery:** size and capacity are still being decided.

How one request works

1. Wake: you say a wake word. Until then, the device only listens for that word.

2. Record: the device records your question and, if needed, takes a picture.

3. Send: the device sends the recording to your phone over Wi-Fi.

4. Think: your phone works out the answer. Heavy processing happens here, so the device can stay small.

5. Answer: the answer comes back and the device speaks it out loud.

6. Sleep: the device goes back to listening for the wake word and saves power.

If the phone cannot be reached

The device can stay silent, play a short status message, or give a few basic offline replies. This choice is still open.

Privacy and trust

• A light shows whenever the microphone or camera is active.

• A physical switch is planned to cut power to the camera and microphone.

• A log may show what was recorded and when, so you can review it.

What is still open

• Where the battery and processor sit: inside the device, or in a separate pocket unit.

- How the device is worn: clip, chest, shoulder, or desk stand.
- Colour, material, and final shape.
- Whether the device only listens for a wake word, or streams everything to the phone.

This document describes a planned concept. It does not describe a finished product.
